Child Development Timeline (Birth to 5 Years) Not all children develop at the same rate and the following information provides general guidance only. Do not be concerned if your child is not meeting all the milestones for their age range; it is perfectly normal for one area to develop quicker than another.

[Child Development | NHS GGC](#)

The early years of a child's life are very important for his or her health and development. Parents, health professionals, educators, and others can work together as partners to help children grow up to reach their full potential.

[Learn About Child Development | CDC](#)

Child development involves the biological, psychological and emotional changes that occur in human beings between birth and the conclusion of adolescence. The main 3 stages of life include early childhood, middle childhood, and adolescence. Early childhood typically ranges from infancy (infancy - LR) to the age of 6 years old. During this period, development is significant, as many of life's milestones happen during this time period such as first words, learning to crawl, and learning to walk.

[Child development - Wikipedia](#)

Child development is a process every child goes through. This process involves learning and mastering skills like sitting, walking, talking, skipping, and tying shoes. Children learn these skills, called developmental milestones, during predictable time periods. Children develop skills in five main areas of development:

[Child development: the first five years | Raising Children ...](#)

Skills such as taking a first step, smiling for the first time, and waving "bye-bye" are called developmental milestones. Children reach milestones in how they play, learn, speak, behave, and move (for example, crawling and walking). Children develop at their own pace, so it's impossible to tell exactly when a child will learn a given skill.

[Child development stages - Wikipedia](#)

Brain Development in Children - The Early Years. Neuroscience research has shown us that early childhood is a time of tremendous brain development. The young brain literally changes shape and size in response to everything encountered in the early years of life. New environment, life experiences, caretakers and relationships can all affect the way a child's brain circuits are wired.

[Brain Development in Children - The Early Years](#)

Physical development is the most readily visible of the child development domains. Parents notice height and weight as well as the development of both fine motor and gross (large) motor skills. It's important to remember that what we can see physically corresponds to what we can't see which is brain development.

[Physical Development in Children and Adolescents - Child ...](#)

Brain architecture. Brain architecture: how children's brains develop. The first Sharing the Science metaphor focuses on brain development by comparing a house's construction to the construction of children's brains. Early experiences build the foundations of our brains.

[Understanding child brain development | NSPCC Learning](#)

It is a complex psychological concept, which originated with the work of John Bowlby, who highlighted the importance of a child's relationship with their primary caregiver (usually their mother) in terms of their social, emotional development and their ability to learn. From the moment a baby is born, the baby communicates emotional and physical needs to their primary carer.
